

**CLAIMS**

*Sub B* 1. A method for transmitting time-sensitive information over a wireless voice-over-data communication system, used in conjunction with a predefined data protocol, comprising the steps of:

4 defining a minimum segment size for information to be transmitted;

6 defining a maximum segment size for information to be transmitted, said second segment size greater than said first segment size;

8 generating a first segment from said time-sensitive information if a sufficient quantity of said time-sensitive information is available for transmission, said first segment having a segment size between said minimum segment size and said maximum segment size; and

10 generating a second segment having a segment size less than or equal to said maximum segment size upon the occurrence of a predefined event.

2. The method of claim 1 wherein said predefined event comprises the receipt of an acknowledgment message.

3. The method of claim 1 wherein said maximum segment size is negotiated between a transmitter and a receiver.

4. An apparatus for transmitting time-sensitive information over a wireless voice-over-data communication system, used in conjunction with a predefined data protocol, comprising:

4 means for negotiating a maximum segment size with a receiver;

6 a memory for storing a minimum segment size;

8 a queue for storing data frames, said data frames representing time-sensitive information; and

10 a first processor for generating at least one segment from said data frames stored within said queue when a segment size greater than or equal to said minimum segment size can be generated from said data frames.

5. The apparatus of claim 4, further comprising a vocoder for generating data frames from said time-sensitive information.

6. A method for transmitting time-sensitive information over a  
2 wireless voice-over-data communication system, used in conjunction with a  
predefined data protocol, comprising the steps of:

4 storing time-sensitive data in a queue, said time-sensitive data  
comprising data frames;

6 generating at least one segment from said time-sensitive data, said at  
least one segment comprising a predetermined number of data frames.

7. The method of claim 6 further comprising the step of generating  
2 said data frames from said time-sensitive information using a vocoder.

4 8. An apparatus for transmitting time-sensitive information over a  
5 wireless voice-over-data communication system, used in conjunction with a  
6 predefined data protocol, comprising:

8 a queue for storing data frames, said data frames representing time-  
sensitive information; and

10 a processor for generating at least one segment from said data frames  
when a predetermined number of said data frames are available in said queue.

12 9. The apparatus of claim 8 further comprising a vocoder for  
receiving said time-sensitive information and for generating said data frames.

14 10. A method for transmitting time-sensitive information over a  
16 wireless voice-over-data communication system, used in conjunction with a  
17 predefined data protocol, comprising the steps of:

18 storing vocoder frames in a queue, said vocoder frames representing  
time-sensitive information;

20 determining the number of bits contained within each of said vocoder  
frames;

22 adding bits to any of said vocoder frames which does not contain at least  
a predetermined number of bits.

24 11. Apparatus for transmitting time-sensitive information over a  
26 wireless voice-over-data communication system, used in conjunction with a  
27 predefined data protocol, comprising:

28 a queue for storing vocoder frames, said data frames representing time-  
sensitive information; and

30 a processor for adding random bits to any of said data frames which  
does not contain at least a predetermined number of bits.
